

Miniature Circular Connectors with Push-Pull Locking in Plastic

Miniature Circular Connectors with Push-Pull Locking in Plastic

Applications:

- Medical
- Industrial
- Measurement and testing
- Military and security
- Energy
- Automotive

Properties:

- Fast and easy mating and demating
- Blind mating and demating in hard-to-access places easily possible
- Low space requirements on the devices
- Clear and reliable locking states
- IP 50 and IP 67
- Shielded model available
- 100 % protection against contact
- Easy cleaning of the housing possible

All shown connectors are connectors without breaking capacity (COC) in accordance with DIN EN 61984:2009.

All dimensions are in mm. Some of the pictures are illustrations. Product data and specifications are subject to change without notice.

ODU MINI SNAP connectors are UL-listed under File E110586 00RT03566.
Tested to MIL (see page 77).

Product Description ODU MINI-SNAP® PC

The ODU MINI-SNAP® Family of Miniature Circular Connectors Features Push-Pull Locking

Circular connectors are generally available with several locking mechanisms.

The most frequently used are

- Threaded-locking sleeve
- Bayonet-locking
- Push-Pull locking

Push-Pull connectors have a very simple locking mechanism

- As the plug is pushed into the receptacle, locking fingers on the plug snap into the receptacle creating a reliable connection between plug and receptacle.
- Pulling on the cable or the rear of plug causes the locking fingers to grab harder and a separation of plug and receptacle is almost impossible. Pulling on the outer plug housing causes the locking fingers to retract and the plug and receptacle separate easily.

Important Issues at a Glance

Certification

The series is certified acc. to  and  2011/65/EC.

3 sizes

Plastic housing available in 3 sizes. Outside diameter between 12.5 mm and 19 mm. Number of contact positions: 2 to 27 positions.

Extensive range of termination possibilities

Contacts with solder, crimp and print (PCB) termination.

Degree of protection IP 50 and IP 67 available

Keying using half-shells

Plug compatible with the ODU MINI-SNAP® Series F metal version

High profitability because

- Contacts can be assembled automatically
- Easy crimp contact assembly using clip technique
- Easy plug assembly
- Economical prices

Further advantages:

- Housing with 100 % protection against contact
- Light
- Low mating forces
- Housing A-magnetic
- Very high chemical resistance
- Shielded version available

Applications

	Insulation body material	Contact material
	PEEK	Ms
General application requirements (– 40° C to +120° C)	●	●
Connectors which are autoclavable (+134° C, see page 76)	●	●

Termination style

	Insulation body material	Contact material
	PEEK	Ms
Crimp termination	●	●
Solder termination	●	●
Printed circuit board (PCB) termination	●	●

Turned Contact

Turned contacts are available in the diameters 0.5 to 4.0 mm.

The contacts are available with following terminations:

Solder, crimp and print (PCB).

Mating cycles	> 5,000
Material	Brass
Treatment processing	Ni; Au on the mating area

For information regarding diameter, termination style and current load please see the contact configuration section.

Termination standard pin contacts

Contact Technology

It is possible to use stamped or turned contacts in the insulator with the ODU MINI-SNAP® PC. Stamped contacts offer primarily economic advantages with regard to both the part price and the total costs for assembly. Stamped contacts are delivered as coiled stamped strips and so can be economically, semi-automatically assembled.

The advantages of the turned contacts are seen in the processing of small quantities (e.g., by soldering) and the higher current-carrying capacity of the individual contacts. Subsequent extrusion of the connector is also possible with solid contacts only. The diagrams show a comparison of the contact technologies.

Compatibility

Connection compatibility

The ODU MINI-SNAP® PC is plug-compatible with the metal version in the F series. Tightness between MINI-SNAP PC Version IP 67 and MINI-SNAP F series Version IP 68 is not ensured, however.

ODU MINI-SNAP PC: Available versions

- IP 50
- IP 50 + EMC protection
- IP 67
- IP 67 + EMC protection

Insert exchangeability

The ODU MINI-SNAP PC is an enhancement and supplement of the ODU MINI-SNAP metal version, and so all inserts from the metal version's F and B series in sizes 1, 2 and 3 can be used in the ODU MINI-SNAP PC.

There are currently roughly 100 different contact arrangements available.

Tools

Crimp

The processing of contacts by crimping in order to produce connection lines results in a permanent, corrosion-free and securely contacted connection. It can also be executed by non-experts, and it is time-saving. The cold pressing (crimping) compresses the conductor and contact material at the compression

points so that a gas-tight connection results that corresponds to the conductor material and cannot be pulled apart. There is no need to reinforce the conductor material at the joint such as is the case with soldering. Crimping is possible on the smallest and largest cross-sections.

Crimping Tools for Stamped Contacts (Part I)

The contacts are supplied on a spool for the termination cross-sections AWG 24/22 and AWG 28/26. When assembled, the contact can be slid into the insulator without further tools with a very low force; it then snaps into place in this insulator. Manual crimping tool for single crimp contacts.

The F crimp results in a well-defined, clean pinch.

Manual crimping tool for single crimp contacts.

Here single contacts are manually positioned in the tool and then crimped.

Crimping Tool and Contacting for Turned Contacts

Crimping instructions

The correct crimp position is reached by using the various positioners. You can select the correct crimp diameter by turning the adjusting screw to the selected number.

The tool has a blocking system, which prevents them from opening before the pressing has been completed.

Termination Technologies

Contact blocks (insulation bodies with contacts) are interchangeable between receptacle and plug. The same applies to the insulator with the socket contacts. As a rule the socket contact blocks are mounted in the part under power (because touch-proof).

With respect to the termination technologies, the type of mounting used for the contacts in the insulator is important. ODU offers the following contact termination styles:

- Solder
- Crimp
- Print (PCB)

Termination styles for turned contacts

Solder termination

The contacts come mounted by the factory. The insulation body and the pre-assembled contacts are called a contact block.

Crimp termination

A single contact is crimped to a single conductor. Subsequently, the crimped contact is pushed into the insulation body. Crimp contacts and insulation bodies are shipped separately.

Crimping creates a reliable, corrosion-free and durable connection between the contact and the conductor. Crimping causes the crimp barrel of the contact and the conductor material to cold flow. It creates a gas-tight connection between contact and conductor.

The ODU MINI-SNAP generally requires the industry standard 8-point crimping tool.

Printed circuit board (PCB) termination

PCB pins are used only for receptacles which are mounted directly to the PCB (Further information upon request).

Solder termination

Crimp termination (Crimp-clip-contact for PEEK Insulator)

Printed circuit board (PCB) termination

Conversions AWL – Cross Section (AWG = American Wire Gauge)

The AWG system describes the cross section of a wire using a gauge number for every 26 % increase in conductor cross section. With larger wire diameters, the AWG gauge numbers decrease; as the wire sizes increase, the AWG gauge numbers decrease. **This is only valid for solid conductors.**

Most wires are made with stranded conductors. Compared to solid conductors stranded wires offer higher durability, higher flexibility and better performance under bending and vibration.

Stranded wires are made from wires with smaller gauge sizes (higher AWG gauge number). The AWG gauge number of the stranded wire is equal to that of a solid conductor of the same size wire. The cross section of the stranded conductor is the sum of cross sections of the single conductors.

For example, an AWG-20 stranded wire of 7 AWG-28 conductors has a cross section of 0.563 mm²; an AWG-20 stranded wire with 19 AWG-32 conductors has a cross section of 0.616 mm².

Conversion table: AWG-mm²

AWG	Circular wire		Cross-section mm ²	Weight kg/km	Max. resistance Ω/km

Current Load of Stamped Contacts

Nominal single contact current load for pin / slotted socket (nominal diameter 0.7)

Mating force: ..0.35.. N

Demating force: ..0.33.. N

Conclusion:

As can be seen in the diagram, for example, with a current load of 4 A, the connection.

- heats to a temperature of approx. 70° C with termination
AWG 26
- heats to a temperature of approx. 79° C with connection
AWG 28

Derating factor

Number of loaded wires	Derating factor
5	0.75
7	0.65
10	0.55
14	0.50
19	0.45
24	0.40

Current Load of Turned Contacts

Nominal single contact current load for pin / slotted socket (nominal diameter 0.5 mm – 1.6 mm)

Maximum operating temperature for standard contacts:
+120° C

Test contact was terminated to largest possible conductor.

Connectors or cables with more than one contact or conductor generate a higher heat than a single contact. Therefore, a derating factor must be applied. For connectors the derating factor is applied according to DIN 57 298 Part 4 / VDE 0298 Part 2. The derating factor is used starting with 5 loaded wires (DIN 41 640 T3).

Derating factor

Number of loaded wires	Derating factor
5	0.75
7	0.65
10	0.55
14	0.50
19	0.45
24	0.40

Operating Voltage acc. to SAE AS 13441-Method 3001.1

The values acc. to SAE AS 13441-method 3001.1 comply with MIL-Std. 1344 – method 3001. The chart values results are acc. to IEC 60512-2; Test 4. The inserts have been tested in mated condition and the test voltage was applied to the pin insert.

75 % of the measured break-down voltage is the basic for the further calculation. 1/3 of this value is the corresponding operating voltage.

All tests were performed at standard environment conditions (room temperature) and can be applied up to an altitude of 2,000 m. For any deviations one has to consider the reduction factor acc. to the relevant standards.

Caution

Electrical appliances: for various applications the safety requirements regarding the operating voltage is even more severe! The relevant data in such cases for the operating voltage are the creepage and clearance distances. For advice on how to choose the proper connector please consult us and indicate the safety standard which your product has to meet.

Test voltage: $\text{Break-down voltage} \times 0.75$

Operating voltage: $\text{Break-down voltage} \times 0.75 \times 0.33$

Electromagnetic Compatibility (EMC)

When discussing electromagnetic compatibility (EMC) one should not only consider the device or the circuit, but also include the network and the entire data communication link. This involves all connecting elements such as conductors and connectors. Electromagnetic interference from the outside into the connector can lead to system malfunctioning. The best way to prevent this is by providing a high-quality shield between the cable and the connector. In order to provide reliable EMC data to our customers we engaged the services of a certified test laboratory to investigate the EMC characteristics of the ODU MINI-SNAP. They tested for us size 00, 0, 1, 2 and 3 MINI-SNAP connectors.

Measurements were conducted using the inductive wire or parallel wire method in accordance with test procedure VG 55214-6-2. In this set-up, the mated connector is connected on one end to a network analyzer and terminated on the other end with a suitable impedance. The inductive wire is then mounted in close proximity along the mated connector pair. The induction wire is a ribbon cable which permits to vary the level of induction by using more or less of the ribbon conductors.

Next, a signal with a frequency range of 10 kHz to 3 GHz is connected to the ribbon cable. The network analyzer is used to measure the amount of signal induced into the

connector circuit. The result is shown as the shielding attenuation AT in dB. It is essential that all leads to the connector are shielded so that no signal can be induced into the circuit at any other place except the connector.

The various attenuation values are plotted on a logarithmic scale as attenuation in dB vs. frequency.

An attenuation of better than – 55 dB is generally required for reliable connector and system operation. It can be shown that our connectors will meet this requirement in all applications.

The following diagram is valid for all series and standard sizes.

Autoclaving of ODU MINI-SNAP® PC Connectors

If required ODU can deliver MINI-SNAP connectors for the following sterilization process: Steam-sterilization with pre-vacuum or gravitation process.

Connectors were tested with autoclave equipment with reference to DIN EN 13060 at 134° C and 200 cycles.
For other sterilization-processes please contact our technical support team.

Sterilization curve:

Please contact our technical team for additional sterilization methods.

Test Standard

In the scope of quality approval the sizes 0 and 3 have been submitted to environmental and mechanical tests acc. to MIL. All tests have been passed.

Test carried out

Definition	Standard
High temperature	MIL-STD 810 F / PV 501

Technical Information / Definitions / Terms

Air gap

Shortest distance between two conductive elements through the air.

Autoclavability

See page 76.

AWG

See page 71.

Chemical resistance

Adhesives, cleaners, or other chemicals are used on our products in a large number of further processing steps. Inappropriate chemicals may chemically damage the material structure and result in material breakage of the plastic bodies. Please follow our processing recommendations and technical instructions in this catalog.

Connector

A component which terminates conductors for the purpose of providing connection and disconnection to a suitable mating component. Depending on the fastening to a cabinet, panel, rack etc. or a cable, they are classification.

Creepage distance

The distance measured across the surface of a dielectric between two contacts or a contact and a metal part. The longer the distance, the lesser the risk of damage or tracking. Minimum creepage distances are specified according to the operating voltage and the applicable isolation group.

Crimping area

The part of a crimp barrel at which the crimp connection is achieved by pressure deformation or by reshaping the barrel around the conductor.

Crimp barrel

A hollow part of a contact which accepts one or more conductors and which may be crimped through the application of a crimping tool.

Crimp connection

The permanent attachment of a contact to a conductor by pressure deformation or by reshaping the crimp barrel around the conductor so that a good electrical and mechanical connection is established. (See page 70).

Delivery

Delivery of the connectors usually as components (that means not assembled). Exception: Solder contacts are factory-installed in the insulation body.

Fixed connector

A connector for attachment to a rigid surface (panel).

Free connector

A connector for attachment to the free end of a wire or cable. Also called free hanging connector or in-line receptacle.

Insertion or withdrawal force

The force required to fully mate or unmate a set of connectors without the effect of coupling, locking or similar devices. The insertion force is usually greater than the withdrawal force. Also called mating and unmating force.

Insulation body

Non-conductive part of a connector, to electrically and mechanically separate live parts and to protect against accidental touch.

Insulation group

Classification of connectors according to the operating and working conditions (insulation groups according to DIN VDE 0110).

Keying

System of projections and grooves on mating connectors which prevent otherwise identical connectors from being mated. This is useful when several connectors of the same style are used in the same application.

Lower limit temperature

The lowest permissible temperature which a connector or a plug-in device is allowed to be operated. At ODU MINI-SNAP -40° C.

Materials

The contacts are made of Cu-alloy and gold-plated. The standard housings are made of Cu-alloy with a matt-chromate surface finish. All other materials and surfaces on special request (see page 69).

Mating cycles

Mechanical operation of connectors and plug-in devices by insertion and withdrawal. One mating cycle comprises one insertion and one withdrawal operation. Nominal single contact current load Current load, which can load every single contact (see page 73).

Nominal voltage

Nominal voltage characterizes a component.

Operating temperature of the ODU MINI-SNAP

Range between upper and lower temperature limits. – 40° C to +120° C (see page 7).

Print (PCB) connection

See page 70.

Printed circuit board

Boards, typically made of epoxy-filled glass fiber fabric, with conductive pattern on one or both sides, or in case of multilayer boards, also imbedded inside the board. They feature metalized holes for soldering wire-mounted components or for the insertion of resilient or rigid press-in pins or instead, pads for attaching components using surface mount technology (SMT).

Reference current

The current at which a connector can be operated permanently simultaneously through all contacts without reaching maximum temperature.

Reference voltage

Normal voltage (VDE 0110) for a connector.

Solder termination

See page 70 termination styles.

Termination cross-section

The indicated cross-sections correspond to a flexible conductor design in accordance with EN 60228:2005 class 5 or to a flexible conductor design (7/19 strands) in accordance with AWG (ASTM B258-02).

Termination techniques

Methods for connecting a wire to an electro-mechanical component, e. g. solderless connection according to IEC 60352: respectively such as crimp, press-in etc. or solder connections.

Test voltage

The voltage the connectors are tested, and are being referred on definite characteristics.

Upper limit temperature

Highest permissible temperature at which a connector or a plug-in device is allowed to operate. This temperature includes the self-heating and the ambient temperature. At ODU MINI-SNAP +120° C (see page 73).

Watertightness (DIN EN 60529)

See page 68.

Wire

Wires may be provided with an insulation cover, an electrical shielding. Cables or conductors may consist of one or more wires.

Connectors shown in this catalogue are designed to operate at high voltages and high frequencies. Care must be taken to assure that no person can come in contact with live conductors during installation or operation of the connectors.

ODU reserves the right to change design and performance of any product to meet changing technical developments without prior notice. ODU reserves the right to discontinue any part in this catalogue without prior notice and without obligation to continue production after the change.

Company Information

Quality Management

ODU has had a powerful quality management system in place for years. ODU has been successfully certified to ISO 9001 since 1994. In addition, the automotive sector of the company is certified to ISO TS 16949. The certification process was carried out by the internationally active BVQI (Bureau Veritas Quality International company).

ODU is also certified according to the medical standard ISO 13485: 2003 + AC: 2007.

In addition, ODU is certificated to DIN EN ISO 14001:2009 as well as to different certifications: VDE, UL, UL wiring harness, SCA, VG and ML.

Your Partner in Many Application Areas

ODU stands for quality, flexibility and reliability. This is why customers working in many application areas rely on ODU products in markets such as the following:

- Medical
- Industrial
- Measurement and testing
- Military and security
- Energy
- Automotive

Overview – All Push-Pull Connector Series from ODU

¹⁾ IP Protection Class in mated condition.

²⁾ IP Protection Class in unmated condition to the end device.

The Complete ODU Product Range

Single contacts (round or flat)			
High current connectors			
Circular connectors with Push-Pull locking			
Modular rectangular connectors			
PCB connectors			
Robust connectors			
Disposable systems			
Application specific solutions			
AMC - Advanced Military Connector			
Cable assembly			

Everything from one Source: ODU – the System Supplier

Each connection needs its individual cable. Make no compromises when it comes to the quality of the complete connection system. ODU gives you the complete system solution from one source, with no intermediary suppliers.

Cable assembly is a very complex subject. It requires equal measures of expertise in the areas of connectors, cables and assembly. ODU meets all these requirements in full.

Our competent assembly team tests the complete system according to your specifications. Our assembly service promises you the same quality found in our connectors – without compromises.

ODU offers you everything from one source

- 100 % final inspections
- Production in clean room according to EN ISO14644-1 possible
- Automated processes (cutting, stripping, attaching)
- Extrusion possible with a hot-melt and high pressure / temperature process
- Ultrasound welding
- EMC-compatible assembly
- Application specific labelling
- Widest range of potting possibilities for sealed systems
- Extruded cable crossovers

Advantages for the customer

- Modern manufacturing facilities in Mühldorf (Germany), Shanghai (China), and Sibiu (Romania)
- Reliability thanks to our company-wide quality strategy
- Products with durability and functional reliability
- Production according to UL (file: E333666) possible
- Inspections, such as crimp force monitoring, during production

Application Specific Connectors

Innovative, dynamic markets call for innovative connectors.

"As an expert for special applications and requirements, we develop forward-looking, appropriate connectors attuned to your needs!"

In spite of the global trend toward standardized connectors, there are always applications that call for an application-specific solution.

We accept this challenge and develop innovative products for our customers based on our many years of extensive know-how, our creativity and, not least, our high level of vertical integration.

Technology access and technology mastery, combined with intensive cooperation with the user, form the basis for achieving success together. Design-to-cost is joined by design-for-application for the customer's benefit.
