

## POWER ELECTRONICS CAPACITORS

# LNK SERIES

DC Applications  
Metallized Polypropylene Film  
Self Healing

# Company profile

## OUR MISSION:

“Develop and supply high-quality capacitors, providing all the customers with full assistance from the design through the delivery.

We will take care to any particular needs that the customer may have.”

Established in 1946, ICAR has rapidly reached, and since then maintained, a leadership position in the research and development of new capacitors and components of which capacitors are key parts.

In the early 60's, first in the world, ICAR started the production of metallized polypropylene film capacitors, by developing the film metallization by its own.

ICAR group nowadays controls all the manufacturing phases of the capacitor: from the polypropylene film extrusion through its metallization, to the production of the finished capacitor.

The know-how accrued in almost 70 years of metallized film production, has enabled ICAR to bring to the market innovative products.

Today ICAR Group is a leader in the production of capacitors, both for power electronics applications and for low and medium voltage power factor correction.

ICAR Group today offers a wide range of products, all manufactured at its 6 plants located in Europe, that includes:

- Power electronics and special capacitors
- Lighting capacitors
- Motor run capacitors
- Power Factor Correction capacitors and Systems
- L.V. and M.V. voltage stabilizers
- Transformers and chokes.

# ICAR: products and solutions

For details of the individual families, download the full catalogs on the web site, [www.icar.com](http://www.icar.com). Here are all the equipment and the solutions ICAR proposes.

Bank for power factor correction

Capacitors and MT power factor correction systems

Power electronics capacitors

Active filters

LV voltage stabilizers

EMI RFI filters

Motor run capacitors

Capacitors for energy storage and rapid discharge

Lighting capacitors

Reactors and LV/LV special transformers

# Quality policy

ICAR, a synonym for capacitor since 1946, has always considered the quality and the effectiveness of its internal processes as a key-factor in the company strategy.

The compliance with International Standards has always been kept as a fundamental reference for offering products and processes which completely match customers' requirements and expectations. ICAR Quality System is certified according to EN ISO 9001:2008 standard and for the products used in railways applications according to IRIS standard.

ICAR representatives are members of the most important international standard committees, in charge for issuing the reference standards for the capacitor industry.

In order to comply with the international regulations and with the most severe customers acceptance criteria, products are submitted to tests both in the internal laboratories and in the most important internationally recognized laboratories.

## Selection rules and definitions

### SELECTION RULES

#### VOLTAGE

Select a capacitor with surge peak voltage ( $U_S$ ), rated voltage ( $U_N$ ) and max ripple voltage ( $U_{rms}$ ) higher than the operating ones.

Consider that:

- Rated DC voltage of the capacitor ( $U_N$ ) shall be higher than the sum of operating dc voltage + operating ripple peak voltage
- Rms ripple voltage shall be lower than 10% of the rated voltage  $U_N$ , and it shall not exceed 150V<sub>rms</sub>

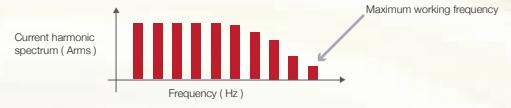

It is possible, within certain limits, to work above the rated voltage but this reduces the expected life of the capacitor.

#### CURRENT

Select a capacitor with maximum current  $I_{max}$ , higher than the operating current  $I_{rms}$

Consider that:

- A thermal check shall be performed (see below) in order to verify that the chosen capacitor does not exceed the max operating temperature at operating  $I_{rms}$
- For each series the  $I_{max}$  has been calculated considering a well defined  $\theta_h - \theta_0$ . The dielectric losses ( $Q \tan \delta_0$ ) have been considered negligible and the harmonic spectrum is supposed to be made of different frequency components ending up to the specified maximum working frequency.  $I_{max}$  should not be considered totally concentrated at the maximum working frequency.

#### THERMAL CHECK

Double check the expected working temperature of the capacitor in your application.

Consider that:

the hot spot temperature can be estimated as follows:

$$\theta_h = R_{th} * P + \theta_0$$

the total dissipated power can be calculated as follows:

$$P = Q \tan \delta_0 + R_s I_{rms}^2$$

During stationary operation  $\theta_h$  must not exceed the maximum hot spot temperature given in this catalogue for each families of capacitors.

#### WARNING

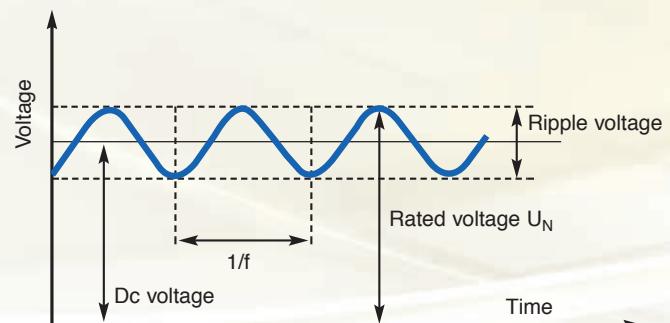

The thermal check is based on the hypothesis that the heat generated into the capacitor is transmitted to the environment through the case surface. Possible localised overheating (poor connections, hot components in the nearby as other capacitors, operation with high harmonics frequency etc.) would bring the capacitor to a dramatic failure or to a reduction of the expected life.

Special tests by means of thermocouples should be performed to be sure that the maximum hot spot temperature is not exceeded even under the most critical ambient circumstances. Capacitors with thermocouples can be supplied on request.

## DEFINITIONS

<b>C<sub>N</sub></b>	Rated Capacitance measured at 20°C	<b>R<sub>th</sub></b>	Thermal resistance between the hot-spot in the winding and the environment (natural cooling), so that: $P=(\vartheta_h - \vartheta_0)/R_{th}$
<b>U<sub>N</sub></b>	Maximum operating peak voltage of either polarity of a non reversing type waveform for which the capacitor has been designed for continuous operation		In case of forced air cooling the thermal resistance will be reduced of 20%.
<b>U<sub>rms</sub></b>	Rated rms ripple voltage = $0.1 \times U_N$ max (max 150 V <sub>rms</sub> )		R <sub>th</sub> is a global parameter that doesn't consider localized overheating due to high frequency current
<b>U<sub>s</sub></b>	Surge (not repetitive) peak voltage	<b>ϑ<sub>h</sub></b>	Hottest point in the capacitor winding $= R_{th} \times P + \vartheta_0$
<b>U<sub>i</sub></b>	Rated insulation voltage. Rms value of the AC voltage for which the terminal to case insulation has been designed and tested	<b>ϑ<sub>0</sub></b>	Operating ambient temperature. It is the air temperature measured under steady conditions at 0,1m from the capacitor case and at two-thirds of the height from its base
<b>I<sub>MAX</sub></b>	Maximum rms current value for continuous operation	<b>T<sub>c</sub></b>	Temperature coefficient of capacitance. The coefficient is equal to $-260 \text{ ppm}/^\circ\text{C}$
<b>Clearance</b>	Shortest distance in air between terminals conducting parts or between terminal and case	<b>L<sub>n</sub></b>	Expected life at rated voltage U <sub>N</sub> and hot-spot temperature of 70°C
<b>Creepage</b>	Shortest distance along an insulated surface between terminals conducting parts or between terminal and case	<b>L</b>	Expected life at the actual working conditions
<b>Q</b>	Reactive power = $2 \times \pi \times f \times C \times U_{rms}^2$	<b>L<sub>s</sub></b>	Self inductance of the capacitor. It is due to the internal connections, terminals, winding characteristics and physical dimensions
<b>f</b>	Frequency of the ripple voltage	<b>λ</b>	Failure rate (FIT) = $10^9 \times \text{failures/component} \times \text{hour}$
<b>R<sub>s</sub></b>	Series resistance representing the sum of all ohmic resistances in the capacitor. Rs is a typical estimated value based on average film metallization parameters		
<b>ESR</b>	Equivalent Series Resistance defined as $\text{ESR} = R_s + \tan \delta_0 / (2 \times \pi \times f \times C)$		
<b>tan δ<sub>0</sub></b>	Dielectric dissipation factor. It can be considered constant in the normal working frequency range. Typical value for polypropylene is $2 \times 10^{-4}$		
<b>tan δ</b>	Dissipation factor calculated as follows: $\tan \delta_0 + 2 \times \pi \times f \times C \times R_s$		
<b>dv/dt</b>	Maximum slope of the voltage waveform		
<b>I<sub>PK</sub></b>	Peak current $I_{PK} = C \frac{dv}{dt}$		
<b>P</b>	Active power (losses)= $Q \times \tan \delta_0 + R_s \times I_{rms}^2$		

### Graphical meaning of rated voltage U<sub>N</sub> and peak to peak ripple voltage

The maximum allowed rms ripple voltage has to be lower than 10% of the rated voltage U<sub>N</sub> (max 150V<sub>rms</sub>)

# Technical Information

## Ratings

Capacitance tolerance:  $\pm 10\%$ ,  $\pm 5\%$  on request  
Useful life: 100.000 hrs at 70°C hot-spot and  $U_N$

## Application

Expressly designed for operation with direct voltage

## Environmental conditions

### Operating temperature

$\vartheta_{min} = -25^\circ C$  or  $-40^\circ C$  depending on the capacitors model  
 $\vartheta_{max} = 70^\circ C$  or  $80^\circ C$  depending on the capacitors model

$\vartheta_{max}$  temperature of the hottest point on the case at which the capacitor may operate

$\vartheta_{min}$  minimum operating ambient temperature at which the capacitor may operate

### Storage temperature

$\vartheta_{smin} = -40^\circ C$ ,  $\vartheta_{smax} = +85^\circ C$

$\vartheta_{smax}$  maximum ambient temperature at which the capacitor may be continuously maintained non-operating

$\vartheta_{smin}$  minimum ambient temperature at which the capacitor may be continuously maintained non-operating

## Humidity class

Class F Max relative humidity: 75% annual on average, 95% 30 days per year, condensation not permitted

## Design

The capacitor consists of metalized polypropylene windings filled with dry resin.

This technology gives many advantages:

- High DC voltage load capability
- High specific ratio capacitance to volume
- High capability to withstand surge currents
- Very good self healing characteristics

## Case material and resin

- Self extinguishing in accordance to UL 94 V0

## UL Approval

Capacitors families identified with simbol  are UL approved:  
UL file E191589

## Environmental Compatibility

LNK series do not contain PCB and is manufactured in accordance to RoHS restrictions

## Protection against accidental contact

All the capacitors are NOT protected against accidental contact

## Discharge

All the capacitors are NOT provided with internal/external discharge device

## Type of protection

Unprotected: no presence of overpressure disconnector/detector

## Assembly/Cooling

The useful life of a capacitor can be dramatically reduced if exposed to excessive heat. In general, an increase in the ambient temperature of  $7^\circ C$  will halve the expected lifetime. Capacitors must be allowed to cool and should be shielded from external heat sources. Special tests by means of thermocouples should be conducted to be sure that the maximum hot spot temperature is not exceeded even under the most critical ambient circumstances. Capacitors shall not be placed near to heat source and a minimum clearance of 20mm between the capacitors shall be maintained

## Overvoltages according to IEC 61071

Overvoltage	Maximum duration
$1,1 \times U_N$	30% of on load duration
$1,15 \times U_N$	30 min / day
$1,2 \times U_N$	5 min / day
$1,3 \times U_N$	1 min /day
$1,5 \times U_N$	30 ms, no more than 1000 times in the lifetime

## Mounting position

LNK capacitors shown in this catalogue can operate in any position without restrictions

## Failure criteria

Capacitors are considered failed when one of the following conditions happens:

- a. short circuit
- b. open circuit
- c. capacitance reduction higher than 5% of the initial value
- d.  $\tan \delta$  increase over 3 times the initial value

Please contact ICAR Tech. Dept. in case of doubt

## Routine dielectric tests

The performed tests before delivery are the following:

- capacitance and  $\tan \delta$  measurement
- D.C. voltage test between terminals ( $1.5 U_N$  for 10s)
- A.C. voltage test between terminals and case  
 $1.414 \times U_N + 1000V$  for 10s but not less than 2000 V

## Risk of Explosion and Fire

Capacitors consist mainly of polypropylene film.

The film may ignite as a result of internal fault or external overload. Appropriate measures should be ensured to avoid any risk of hazard in the event of failure.

FIRE LOAD: 46MJ/kg

EXTINGUISH WITH: solid extinguish agent, CO<sub>2</sub>, foam

## Storage and handling

We suggest not to keep the capacitors stored for more than 6 years.

After 1 years of storage, we recommend before energizing a preliminary measurement of capacitance and dissipation factor.

Polypropylene film capacitors do not need to be energized before using (polypropylene film capacitor do not need reforming process as for electrolytic one).

Storage condition to be respected are the following:

- Relative humidity: 75% annual on average
- Maximum relative humidity: 95%, 30 days per year
- Condensation: not permitted
- Minimum storage temperature: -40°C
- Maximum storage temperature: +85°C

Capacitors shall be stored indoors packed.

Do not store capacitors in corrosive atmosphere (as example it is not allowed the presence of chloride and sulphide gas, acid, alkali, salt or equivalent substances).

Move packed capacitors with care, especially when using a fork lift truck. Do not strain connectors.

The theoretical expected life time curves given in "Operating Life pag.7" are not applicable after 2 years storage

## Maintenance

Before any operation, disconnect the capacitor or the bank, wait 5 minutes, short-circuit and earth the terminals.

Do not touch any capacitor terminal if not previously short circuited and earthed.

Periodical checks and inspections are required to ensure reliable operations: disregarding the following basic maintenance rules may result in severe operation, bursting and fire.

### Two weeks after installation

- current measurement in the capacitors and comparison with the nominal one. In case of difference from the nominal value, check the capacitors and the application where they are installed
- check the tightness of the connection and terminals. This operation is always required before the start up.

### Periodically\* (at least every year)

- visual inspection in order to check mechanical deformation;
- clean the bushings and terminal boards to avoid short circuit due to dust or contaminants
- check the temperature in the cabinet where the capacitors are installed. An increase of temperature could be an indication of reduced efficiency of the cooling systems due to dust and other contaminants
- current measurement in the capacitors and comparison with the nominal one. In case of difference from the nominal value, check the application where they are installed
- check the surface temperature of energized capacitors. In case of excessive temperature is recommended to replace the capacitor. This could be due to an increase of loss angle which is an indication of reached end of life
- check the tightness of the connection and terminals
- perform a C and  $\tan \delta$  measurement. In case of capacitance reduction higher than 3% of the initial value or in case of  $\tan \delta$  increase over 3 times the initial value, capacitors shall be replaced.

\* maintenance schedule has to be established according to the specific operating conditions (for instance, in a polluted environment cleaning should be more frequent) and to the total safety requirement of the whole equipment where they are installed.

# Operating Life

The lifetime of a capacitor depends on the hot spot temperature and on the field strength in its dielectric during operation. The capacitors have been designed for an average probable service life of 100.000hrs at rated duty (voltage, temperature and frequency).

Lifetime is a statistical value calculated on the basis of experience and on theoretical evaluations.

It does not have an absolute value and it is not possible to transfer automatically data coming from a limited quantity of capacitors to a whole population or even to a single batch of capacitors.

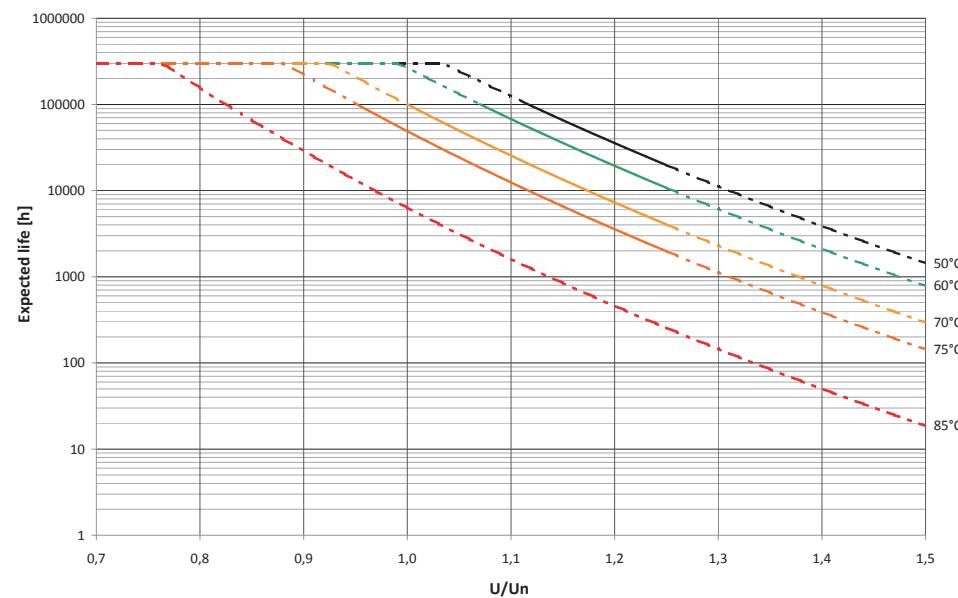

The following diagrams show the correlation between useful life, hot spot temperature and operating voltage.

The diagrams should be considered only as a theoretical reference.

In the lifetime graphic, statements for more than 300.000hrs are cut off as they are technically unreasonable.

Dashed lines underline an high degree of uncertainty in case of voltage and hot temperature far from the rated ones, whose effect is a wide scattering in the experimental data. Please consult our technical department in case of working condition different from the rated ones.

**Theoretical expected life time vs voltage and hot spot temperature**

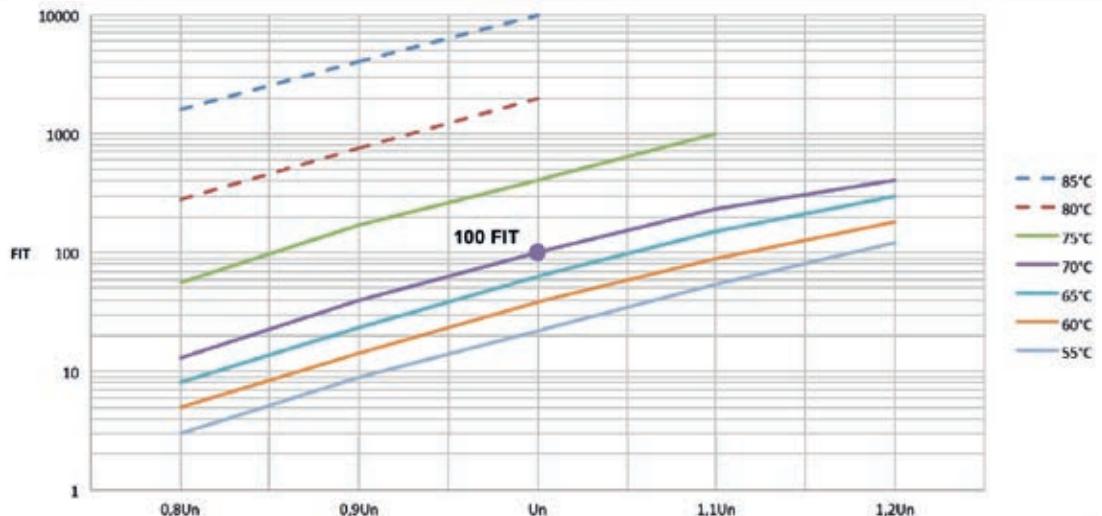

# FIT Rate

Failure probability of a component is a statistical value described by a log normal distribution. It is related to an operating lifetime of 100.000hrs with hot spot temperature of 70°C. Failure considered are short circuits, interruptions, capacitance drifts exceeding 5% out of the rated tollerance limit and tan δ increase over 3 times the initial value.

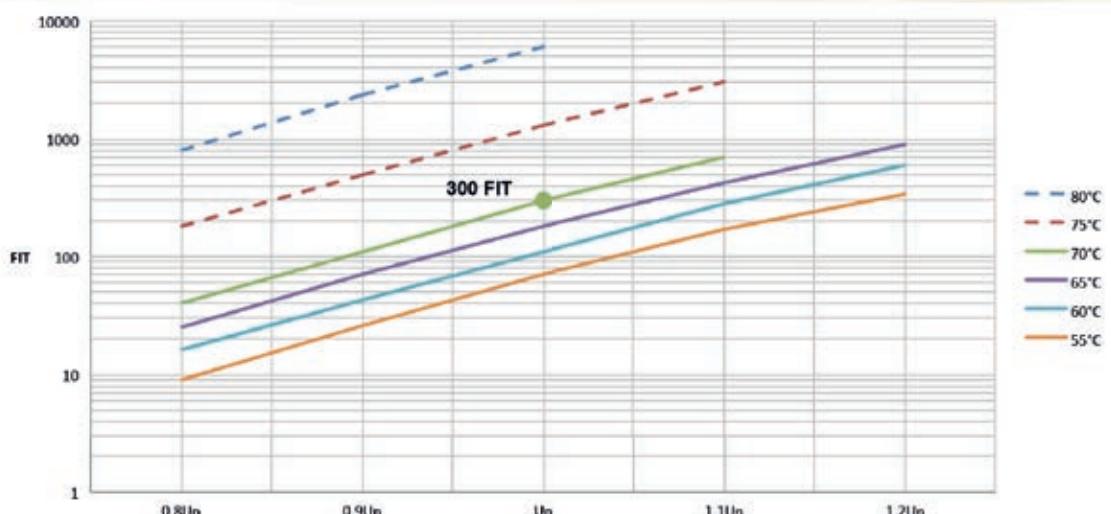

FIT is a statistical parameter coming from the empirical experience and should be considered as an approximate information about the effect of voltage and temperature conditions. It is not possible to automatically transfer the data coming from a limited quantity to a whole population or even to a batch of capacitors.

A simultaneous operation of capacitors at highest permissible voltage and operating temperature should be avoided otherwise, failure rate may increase.

**Applicable for LNK-P1, LNK-P2, LNK-P3, LNK-P4, LNK-P5, LNK-P6 LNK-P7 LNK-P8 and LNK-M3 series.**

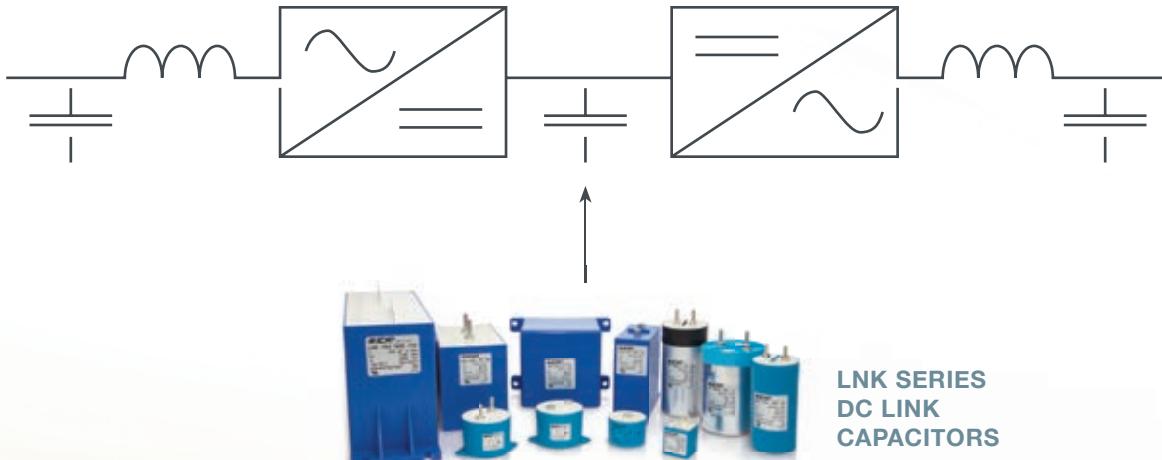

**Applicable for LNK-P9 series.**

# LNK Series

## THE EFFECTIVE WAY TO REPLACE ELECTROLYTIC CAPACITORS

### KEY POINTS

- COMPACT DESIGN
- LOW LOSSES
- HIGH RIPPLE CURRENT
- DRY TECHNOLOGY I.E. NO LEAKAGE PROBLEMS
- SELF EXTINGUISHING RESINS AND PLASTICS ACCORDING TO UL94
- ON REQUEST, TECHNICAL DESIGN WITH DIFFERENT REQUIREMENTS AND HAZARD LEVELS ACCORDING TO EN 45545

## ADVANTAGES OF LNK CAPACITORS AGAINST ELECTROLYTIC CAPACITORS

A **typical industrial converter** basically consists of an AC/DC section (to convert the AC voltage of the grid into a DC voltage) and a DC/AC section either at variable frequency (motor drive) or fixed frequency (generators or UPS).

These two parts are connected through a DC bus (link circuit) where capacitors are required in order to filter the high frequency components (DC Link Capacitors).

Most important requirements for these capacitors are:

- capability to withstand high currents at frequencies above 1000 Hz
- high energy density (Joule/dm<sup>3</sup>)

**Electrolytic Capacitors** banks are used up to a voltage of 2000V, but their limits are:

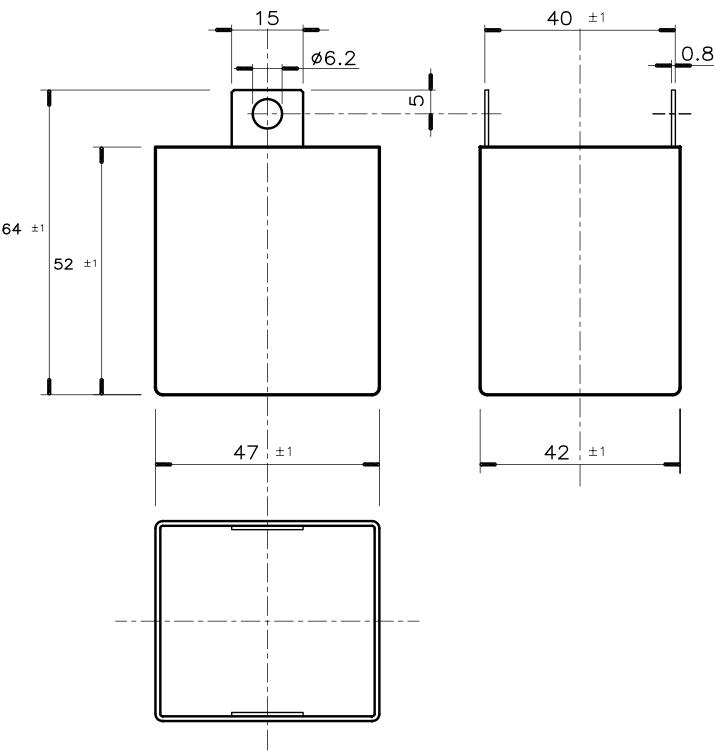

- maximum working voltage across each capacitor limited to about 450÷500V
- maximum current, especially at high frequency, limited by the high ESR (Equivalent Series Resistance) typical of this technology.

For these reasons, in general, Electrolytic Capacitors have to be connected in series/parallel to form banks able to withstand the voltages and the currents required by the application.

**Polypropylene film capacitors** are able to overcome these limits and **in most cases they are able to replace favourably electrolytic capacitors** in applications where the voltage is above 500Vdc.

Main advantages of Metallized Film Capacitor are:

- High current per capacitance (A/ $\mu$ F)
- High voltage per element
- High capability to withstand overvoltages up to 2 times the rated voltage
- More than 10 years estimated lifetime
- Easy connections and low equivalent inductance
- Non polar dielectric
- No leakage of dangerous or poisonous electrolytes.

## LNK - P1X

- VERY LOW INDUCTANCE
- SMALL SIZE
- RESIN COMPLIES WITH REQUIREMENT R22, HL2 ACCORDING TO EN 45545

Failure rate: 100 FIT  
Operating Temperature -40°C / +70°C  
Maximum hot spot 85°C

- In order to decrease the thermal resistance, the capacitor should be installed on a heatsink through an heat conductive paste.
- The thermal resistance is estimated considering the capacitor alone, not fixed and in free air condition (natural convention)
- In case of doubt regarding the full current maximum working frequency, please contact ICAR Tech. Dept. for de-rating according to current spectrum
- Routine dielectric test: DC voltage test between terminals = 1.5 U<sub>N</sub> x 10 s, AC voltage test between terminals and fixing stud = 1.414U<sub>N</sub> + 1000 x10s or 2000V whichever is the highest value
- I<sub>max</sub> has been calculated for a thermal rise θ<sub>h</sub> – θ<sub>0</sub> within about 30°C (for more details see "Selections rules and definitions").

## LNK - P4X

ULfile: E191589

- HEAVY DUTY CONSTRUCTION
- EXTERNAL RESIN AND CASE COMPLIES WITH REQUIREMENT R22, HL2 ACCORDING TO EN 45545

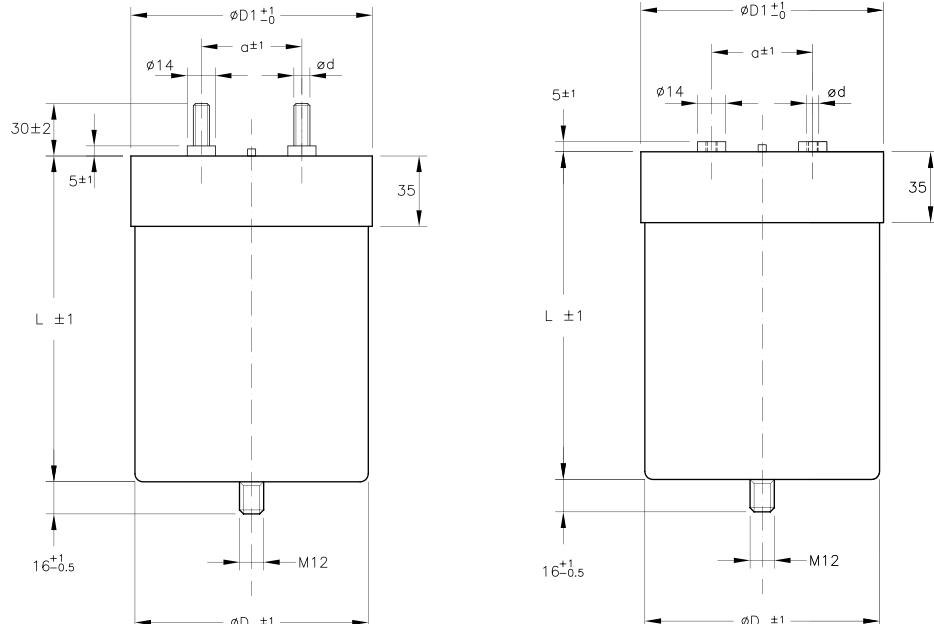

Failure rate: 100 FIT  
Operating temperature -40°C / +80°C  
Max hot spot 85°C (70°C for 650V)

- In case of doubt regarding the full current maximum working frequency, please contact ICAR Tech. Dept. for de-rating according to current spectrum
- The thermal resistance is estimated considering the capacitor alone, not fixed and in free air condition (natural convection).
- Routine dielectric test: DC voltage test between terminals = 1.5 U<sub>N</sub> x 10 s, AC voltage test between terminals and case = 1.414U<sub>N</sub> + 1000 x 10s or 2000V whichever is the highest value
- I<sub>max</sub> has been calculated for a thermal rise θ<sub>h</sub> – θ<sub>0</sub> within about 25°C (for more details see "Selections rules and definitions").

- In case of doubt regarding the full current maximum working frequency, please contact ICAR Tech. Dept. for de-rating according to current spectrum
- The thermal resistance is estimated considering the capacitor alone, not fixed and in free air condition (natural convection).
- Routine dielectric test: DC voltage test between terminals = 1.5 U<sub>N</sub> x 10 s, AC voltage test between terminals and case = 1.414U<sub>N</sub> + 1000 x10s or 2000V whichever is the highest value
- I<sub>max</sub> has been calculated for a thermal rise θ<sub>h</sub> - θ<sub>0</sub> within about 25°C (for more details see "Selections rules and definitions").

## LNK – P5Y

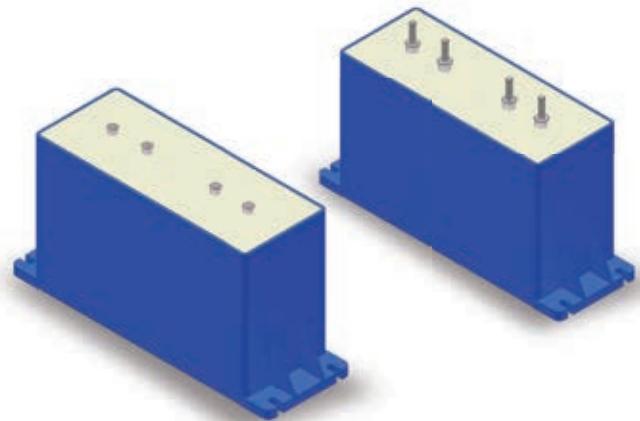

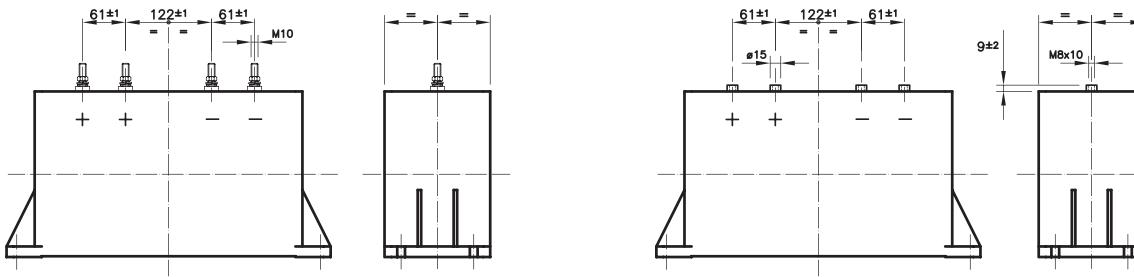

ULfile: E191589

- HIGH CAPACITANCE
- LOW INDUCTANCE CONNECTIONS
- STANDARD CONFIGURATION
- EXTERNAL RESIN COMPLIES WITH REQUIREMENT R22, HL2 ACCORDING TO EN 45545

Failure rate: 100 FIT

Operating temperature -25°C / +70°C  
Maximum hot spot 85°C (70°C for 450V and 600V)

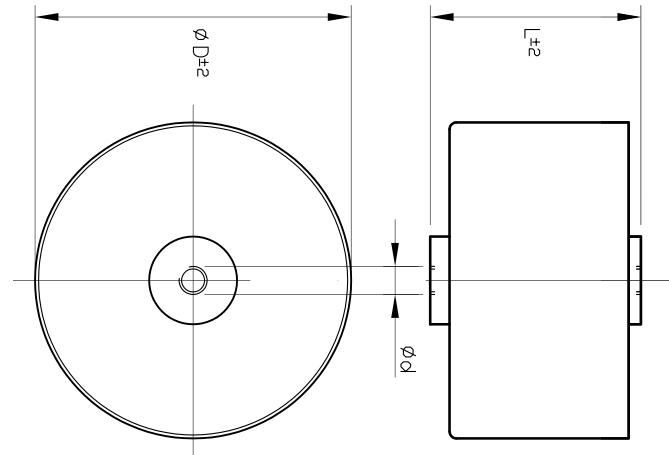

CUSTOM VERSIONS WITH SCREWS OR THREADED HOLES TERMINALS ARE AVAILABLE ON REQUEST

- In case of doubt regarding the full current maximum working frequency, please contact ICAR Tech. Dept. for de-rating according to current spectrum
- The thermal resistance is estimated considering the capacitor alone, not fixed and in free air condition (natural convention)
- Routine dielectric test: DC voltage test between terminals = 1.5 U<sub>N</sub> x 10 s
- I<sub>max</sub> has been calculated for a thermal rise θ<sub>h</sub> - θ<sub>0</sub> within about 30°C (for more details see "Selections rules and definitions").

New version at 450V, 600V 2000V and 2200V

## LNK – P6X

- VERY LOW INDUCTANCE
- 🔥 RESIN COMPLIES WITH REQUIREMENT R22, HL2 ACCORDING TO EN 45545

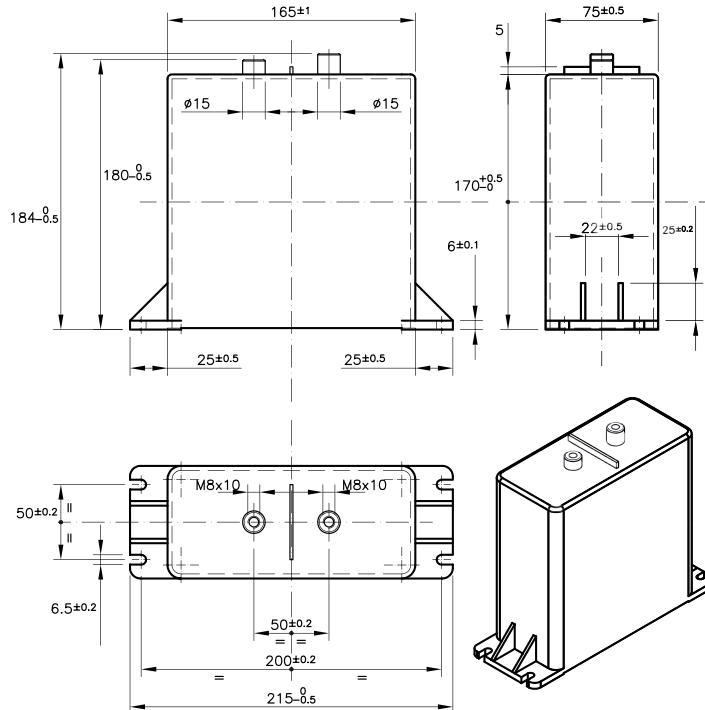

Failure rate: 100 FIT  
Operating temperature -25°C / +70°C  
Maximum hot spot 85°C (70°C for 450V and 600V)

- I<sub>max</sub> has been calculated for a thermal rise θ<sub>h</sub> – θ<sub>0</sub> within about 35°C (for more details see "Selections rules and definitions").

# Custom DC link capacitors

Beside the standard products shown in this catalogue, ICAR produces also a wide range of custom capacitors. ICAR technical department is ready to support customers in developing capacitors based on their requests and specifications.

## Custom capacitors for DC link are grouped as follows:

- **LNK-P** series are the capacitors based on the same technology as standard products: metallised polypropylene film, plastic case, dry type resin filled. Customization is mostly related to connections, capacitance value and other special characteristics; the cases are the same used in the standard series.
- **LNK-M** series are metallised polypropylene film, metal cases (aluminium or steel) capacitors, dry type resin filled. Beside the personalization of the P series, the metal case allows our designers to follow mechanical requirements of the customer without any investment related to the plastic case mould.
- **BIOENERGY-D65** series are metallised polypropylene film, metal case (aluminium or steel) capacitors, oil filled. This solution is generally suggested for higher voltage applications

The range of our customized products is extremely wide and covers most of the possible requirements in the railway and traction equipments, industrial drives, wind and solar inverters, special industrial plants.

For any further information please contact our sales department: [sales@icar.com](mailto:sales@icar.com).

# Warning

## DO NOT MISAPPLY CAPACITORS FOR POWER ELECTRONICS

Icar is not responsible for any kind of possible damages to persons or things, derived from the improper installation and application of Power Electronics capacitors

### MOST COMMON MISAPPLICATION FORMS:

- Ripple current and peak current beyond specification or not according the maximum power that can be dissipated.
- Surge or working voltage beyond specified value.
- Hot spot or storage temperature beyond the specified limits or not according the maximum power that can be dissipated.
- Incorrect mounting or wrong installation
  - installation nearby hot components or heat sources
  - not suitable connections (not adequate cable or busbars cross section)
  - nuts and washers material, shape or size not suitable for the application
  - tightening torque not according to the specification
- Unusual service conditions as:
  - mechanical shock and vibrations
  - corrosive or abrasive conductive parts in cooling air
  - oil or water vapour or corrosive substances
  - explosive gas or dust
  - radioactivity
  - excessive and fast variations of ambient conditions
  - areas higher than 2000 m above sea level

Periodic check of the connection conditions and tightening torque is strongly recommended.

In case of doubt in the right capacitor **Icar technical service MUST be contacted.**

### DISCLAIMER

All the information and data shown in this catalogue are not binding and can be modified without notice.  
Contact ICAR sales department to get updated specifications.  
Reliability data by ICAR are based on statistical evaluations, and does not guarantee performances of each single component.

All the products described in the catalogue shall be used within the limits stated in the technical specifications, nevertheless it is that a failure or an abnormal operation, even when capacitors are working within the specified limits, cannot be completely excluded or foreseen at the current state of the art of technology.

Capacitors may become hazardous.  
Most common risks are related to combustible gas generation, explosion, fire, electrocution or abnormal operation of the capacitor. In order to reduce the risk of explosion, capacitors shall not be mounted in hermetically sealed enclosure with no air exchange. Not all the possible risks and safety measures are mentioned in this catalogue, further information are available on request. It is on customer responsibility to select and take all the necessary safety measures in order to avoid any possible personal injury or property damage related to the use of capacitors.  
This is particularly valid in for applications in which a failure or an abnormal operation of the capacitors could put at risk human life or health.

ICAR SpA and all the persons acting on its behalf, disclaim any and all liabilities for possible damages resulting from the use of the products described in this catalogue or in any other publication.

ICAR reserves the right to discontinue the production of any item without notice. All orders are subject to ICAR General Conditions of Sales – latest revision.
