

# **SOC<sup>®</sup>**

**Protectors for all electronic circuits and equipment**

**Fuses   Fuseholders   Fuse clips**

## How to use this catalog

The following is an example of how to search for a fuse satisfying the requirements shown below:

<Example>

Rated voltage : DC 70 V or more

Shape : Surface mount type

Dimensions :  $W2\text{ mm} \times H1.2\text{ mm} \times L4\text{ mm}$  or less

Characteristic : Inrush-withstand

Region of use : North America

Rated current : 1.25 A

Step 1

Step 2

Step 3

Step 4

Step 5

Step 6

### Step 1

Select a rated voltage for the fuse suitable for the circuit in which it is to be inserted.

\* Do not select AC fuses for DC circuits, and vice versa.

\* Select a rated voltage higher than the voltage of the circuit.

DC42V max.

DC100V max.

DC450V max.

DC700V max.

AC100V max.

AC125V max.

AC250V max.

AC600V max.

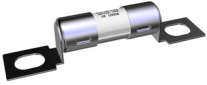

Page 9

### Step 2

Select the shape.

### Step 3

Select the dimensions and proceed to the listed page.

Rated voltage	Shape	Dimensions	Page
DC72V		$W2.57\text{mm} \times H2.57\text{mm} \times L6.1\text{mm}$	22
		$W1.6\text{mm} \times H1.05\text{mm} \times L3.2\text{mm}$	23
		$W1.5\text{mm} \times H1.2\text{mm} \times L2.4\text{mm}$	23
		$\phi 10\text{mm} \times L32\text{mm}$	23

Page 23

### Step 4

Select the time/current characteristic.

### Step 5

Select the region of use.

### Step 6

Confirm the product name and rated current range of the selected fuse and proceed to the listed page.

Rated voltage	Dimensions	Characteristic	Region of use			Product name	Rated current	Page
			Japan	North America	Europe /Asia			
DC72V	$W1.6\text{mm} \times H1.05\text{mm} \times L3.2\text{mm}$	Quick-acting	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	11CF	100mA - 10A	32
			<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	P11CF	100mA - 10A	33
		Inrush-withstand	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	11CT	100mA - 10A	33
			<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	P11CT	100mA - 10A	34

Page 33

**Fuse selection completed** Confirm the detailed specifications of the selected fuse.

If you cannot find a fuse satisfying your requirements, please contact your local SOC sales representative. Fuses marked with the symbol  specified in the Electrical Appliance and Material Safety Law of Japan are not contained in this catalog. Please contact your local SOC sales representative for fuses marked with this symbol.

## IMPORTANT

Before proceeding with final fuse selection, be sure to read Fuse Selection Process on P. 178 and Safety Precautions on P. 194.

## Product name composition for orders

### ■ Surface mount type

<Example> 11CT 1A R08B4

### ■ Sub-miniature type with leads

<Example> 25RF 500mA F003

### ■ Cartridge type

<Example> MT3 2.5A N1 F013

## RoHS-compliant

SOC offers products that comply with the EU Directive on the restriction of the use of certain hazardous substances in electrical and electronic equipment (RoHS).

The individual product specification pages for RoHS-compliant products use the following marks:

RoHS

~~Pb~~

- Products that do not use lead, cadmium, mercury, hexavalent chromium, PBB (polybrominated biphenyls), or PBDE (polybrominated diphenyl ethers)

RoHS

- Products that use lead in solders that are exempted from the requirements of the EU RoHS Directive\*

\* High melting temperature type solders containing more than 85% lead by weight

## BM-SS-I-14

Fuse size :  $\phi 5.2\text{mm} \times \text{L} 20\text{mm}$   
 Rating : 15 A, 250 V  
 Certification : UL Recognized  
 Base material : Phenolic resin  
 (UL94V-0)  
 Terminals : #187 Tab  
 Surface treatment : Nickel plated

## BM-LQ-I-13

Fuse size :  $\phi 6.35\text{mm} \times \text{L} 30\text{mm}$   
 $\phi 6.35\text{mm} \times \text{L} 31.8\text{mm}$   
 Rating : 30 A, 250 V  
 Certification : UL Recognized  
 Base material : Phenolic resin  
 (UL94V-0)  
 Terminals : #250 Tab  
 Surface treatment : Tin plated

## BM-LQ-I-15

Fuse size :  $\phi 10.3\text{mm} \times \text{L} 38.1\text{mm}$   
 Rating : 30 A, 250 V  
 Certification : UL Recognized  
 Base material : Phenolic resin  
 (UL94V-0)  
 Terminals : #250 Tab  
 Surface treatment : Nickel plated

### ⚠ CAUTION

- The ratings listed on the fuseholders shown above represent the maximum ratings for UL-compliant fuses which can be employed. When IEC-compliant fuses are to be used in the fuseholders, please contact your local SOC sales representative as the maximum ratings may differ between the UL and IEC standards.
- When inserting a fuse into a fuseholder, care must be taken to avoid forcing the fuse into the fuseholder with excess pressure or mechanical impact. Such mishandling may result in cracking of the fuse body and may significantly affect its ability to safely interrupt current.
- Forcing a fuse into a fuseholder may create additional space between the contacts of the fuseholder clip. This can cause contact failures and abnormal rises in temperature, resulting in changes to the fuse performance and shortening of its service life, and may eventually lead to nuisance operations.

## H-0016-2

# Technical information

## Soldering specifications

### ■ Surface mount fuses

#### Reflow soldering

(11CT / 25CT / 36CFA\* / 36CT type)

Soldering can be repeated a maximum of 2 times under the conditions specified above.

\* Please ensure that the height of the fillets is not more than one-third of the entire height for 36CFA type fuses.

#### Reflow soldering

(MCF2 type)

Soldering can be repeated a maximum of 2 times under the conditions specified above.

### ■ Sub-miniature fuses with leads (25RT type)

- Wave soldering  
Solder bath temp.: 260°C or less  
Duration: 10 s or less
- Hand soldering with soldering iron  
Soldering iron tip temp.: 380°C or less  
Duration: 5 s or less

### ■ Pin terminal fuses (SM4 / SMC type)

- Wave soldering  
Solder bath temp.: 265°C or less  
Duration: 5 s or less
- Hand soldering with soldering iron  
Soldering iron tip temp.: 350°C or less  
Duration: 2 s or less

### ■ Cartridge fuses with leads

#### Wave soldering

Lead wire diameter	Length between the fuse body and the side to be soldered (L)
φ 0.5mm, φ 0.6mm	5mm or more
φ 0.8mm, φ 1.0mm, φ 1.2mm	8mm or more

Preheating temp.: 80°C-140°C  
Preheating time: 30 s-60 s  
Solder bath temp.: 260°C or less  
Duration: 7 s or less

#### Hand soldering with soldering iron

Lead wire diameter	Length between the fuse body and the side to be soldered (L)
φ 0.5mm, φ 0.6mm, φ 0.8mm, φ 1.0mm, φ 1.2mm	5mm or more

Soldering iron tip temp.: 380°C or less  
Duration: 3 s or less

■ Fuses are sensitive to heat. The soldering conditions shown above are examples based on the use of SOC facilities. Sufficiently evaluate and examine your company's soldering conditions as they may vary depending on such factors as the facilities, solder type, solder quantity, board size, and board materials to be used.

■ Board and solder used at SOC  
Board: Glass epoxy, thickness 1.6 mm  
Solder: Sn-3.0Ag-0.5Cu

## Whiskers

The following tests are performed to ensure that there is no whisker generation on the tin-plated parts of our products.

■ Temperature cycling test

After test samples are subjected to 500 cycles of temperature cycling as specified below, there shall be no whisker generation when observed using a microscope having a magnification of 40 times.

■ Constant temperature and humidity test

After test samples are left at a temperature of  $85^\circ\text{C}$  and an RH of 85% for 500 h, there shall be no whisker generation when observed using a microscope having a magnification of 40 times.

## Storage conditions

Prerequisite:	Products shall be packaged as delivered.
Ambient temperature:	$-20^\circ\text{C} - +40^\circ\text{C}$
Ambient humidity:	85% RH or less
Storage environment:	Not exposed to corrosive gas or sea breeze. Not exposed to direct sunlight. Not subjected to loads which could cause deformation of the products.
Storage period:	Within one year from the shipping date on the product packaging.

■ Lead wire forming

• When forming by hand

○ Correct

× Incorrect

• When forming with forming dies

When forming lead wires, always secure the area between the fuse body and the part of the lead wire to be formed as shown in the figure above. Make sure not to put any stress on the area connecting the fuse body with the lead wire.

# Fuse selection process

Keywords

## Fuse selection process

Fuses can prevent accidents including the electronic circuit emitting smoke and/or catching fire by opening the circuit if any abnormal current passes through it. However, selection of a fuse inappropriate to the intended protection purpose may lead to nuisance operations and the inability to open the circuit in the case of abnormal currents, which may result in accidents.

Nuisance operations

## Safety precautions when selecting fuses

### ■ What is the voltage of the circuit where the fuse is to be inserted?

The rated voltage of a fuse indicates the maximum voltage of a circuit for which the fuse can safely interrupt the circuit's abnormal current up to its breaking capacity without bursting. Please exercise caution when the voltage of the circuit is higher than the rated voltage of the fuse, as the fuse may break as shown in Figure 1.

Rated voltage

【Figure 1】 Example of a breaking test where the circuit voltage is higher than the rated voltage of the fuse

! Make sure to select a fuse with a rated voltage higher than the voltage of the circuit.

### ■ Will the fuse be inserted in an AC circuit or a DC circuit?

The breaking ability of a fuse will differ depending on whether the circuit is an AC or a DC circuit. Fuses intended for use in AC circuits should therefore not be employed in DC circuits, and vice versa, as this may result in accidents.

AC circuit

DC circuit

In AC circuits, arcing tends to be extinguished near a voltage zero crossing point as in Figure 2. In the case of DC circuits, however, care should be exercised as arcing, which can cause the fuse to burst, may persist because there is no zero crossing of the power supply voltage. Therefore, only use fuses with DC rated voltage in DC circuits.

Arcing

【Figure 2】 Current breaking waveform differences between AC and DC circuits

! Only select fuses with DC rated voltage for DC circuits, and those with AC rated voltage for AC circuits.

## Keywords

Power factor  
Time constant  
Recovery voltage

Electrical  
Appliance and  
Material Safety  
Law  
UL/CSA  
IEC

### ■ What is the power factor/time constant of the circuit in which the fuse is to be inserted?

The size of the inductance of the circuit relates to the magnitude of the power factor or the time constant. When the fuse interrupts an abnormal current in a circuit with a large inductance, a large recovery voltage is generated and this can prevent the fuse from breaking the current.

! When selecting fuses, please confirm that the fuse you have selected can safely clear abnormal currents in the equipment in which it is to be used.

### ■ How will the fuse be installed?

The basic shapes and dimensions of fuses are determined by various standards, as per Table 1 on P. 180. The Electrical Appliance and Material Safety Law of Japan and the UL/CSA standards limit the maximum dimensions, while the IEC standards restrict both the shapes and dimensions of fuses.

Surface mount type

Steady-state  
current

Inrush current

Abnormal  
currentSteady-state  
current

I-t curve

## ■ How many amperes will flow through the circuit the fuse is to be used in?

A rated current is defined for each fuse, and this value is marked on it. When selecting fuses by rated current, it is important to fully examine the following current conditions (including current waveform) of the circuit in which the fuse is to be inserted, in order to prevent nuisance operation of the fuse and ensure that all necessary protection goals are met.

- Steady-state current
- Inrush current
- Abnormal current

### (1) Evaluation of a steady-state current

In order to minimize nuisance operations and ensure a long service life, select fuses so that their time/current characteristic (I-t curve\*) guarantees an adequate margin against the steady-state current (r.m.s. value) of the equipment they are to be employed in (the    area in Figure 4).

The margin required for your application should be determined based on evaluations made in your actual equipment as this may vary depending on usage conditions.

【Figure 4】 Fuse selection example for a steady-state current

#### \* I-t curve

An I-t curve is a plot of the average pre-arcing times measured with various constant currents being applied to the fuse as shown in Figure 5, and does not guarantee fuse characteristics.

Current applied	Average pre-arcing time
30 A	0.018 s
20 A	0.058 s
10 A	0.33 s
7 A	0.91 s
5 A	3.9 s
4.5 A	82 s

【Figure 5】 Example of how to plot an I-t curve

## (2) Evaluation of an inrush current

Variations in inrush current are generally so complicated that it is difficult to evaluate the inrush current by means of an I-t curve.

When the fuse is less affected by heat dissipation (e.g., when a current has flowed for only a short period of time), it is possible to evaluate the occurrence of nuisance operations by comparing the Joule integral of the current waveform of the circuit ( $I_m^2t$ ) with the pre-arcing  $I_f^2t$ -t characteristic of the fuse.

Evaluation process:

- ① Repeatedly measure the current waveform data of the equipment from the inrush current at power-on to the steady-state current.
- ② When there is a capacitor in the circuit, measure the current waveform data after completion of the discharge. When there is a device like a thermistor whose resistance varies depending on the temperature, measure the current waveform data under the conditions where impedance of the circuit is at the minimum.
- ③ Based on the measured current waveform, calculate the  $I_m^2t$  as follows:

$$\begin{aligned} I_m^2t &= \sum i_m^2 \times \Delta t \quad (\Delta t: \text{Sampling time}) \\ &= \int_0^t i_m(t)^2 dt \end{aligned}$$

- ④ Plot the obtained  $I_m^2t$  as in Figure 6.
- ⑤ In order to prevent nuisance operations caused by aging, it is necessary to select a fuse so that the  $I_f^2t$ -t curve of the fuse guarantees enough margin against the maximum  $I_m^2t$  of the equipment (the    area in Figure 7). The required margin should be determined based on evaluations made using your actual equipment as this may vary depending on usage conditions.

## (3) Evaluation of an abnormal current

Measure the maximum possible abnormal current, and select a fuse whose rated breaking current is larger than that value.

For the minimum possible abnormal current, select a fuse which meets the conditions of the following formula:

$$I_f^2t \leq I_m^2t$$

Example of a current waveform of equipment

【Figure 7】 Fuse selection example for an inrush current

**! Before final fuse selection, always test the proposed fuse in your actual equipment to ensure that the fuse satisfies all your operational and safety requirements. Please contact your local SOC sales representative for help in selecting fuses.**

Inrush current

Joule-integral

$I_f^2t$ -t curve

Abnormal current

Rated breaking current

## ■ Explanation of rated current

Testing conditions differ even among fuses with the same rated current depending on the standard. Each standard specifies the pre-arcing (clearing) times for the multiple of the rated current ( $I_N$ )\* as per Table 2 below. For details about these specified times, please refer to Table 3.

Accordingly, as in Figure 8, I-t curves differ depending on the standard even when the rated current is the same.

【Figure 8】 Examples of I-t curves for the same rated current based on different standards

\*  $I_N$  indicates the rated current. For example,  $2.0 I_N$  indicates a value of twice the rated current.

【Table 2】 Examples of current carrying capacities/endurance tests and overload operations/pre-arcing time/current characteristics for cartridge fuses compared by standard

Ordinances and standards		Current carrying capacity/ Endurance test	Overload operation/ Pre-arcing time/current characteristic
UL 248-1 UL 248-14 CSA C22.2 No.248.1 CSA C22.2 No.248.14		Shall carry $1.0 I_N$ until temperature stabilization occurs.	Within 60min at $1.35 I_N$
Paragraph 1, Appended Table 3, Chapter 2 of the Ministerial Ordinance establishing technical requirements for electrical appliances and materials	Miniature cartridge fuses marked with the symbol ㊤	Shall carry $1.1 I_N$ until temperature stabilization occurs.	Within 60min at $1.35 I_N$
	Miniature cartridge fuses marked with the symbol ㊦	Shall carry $1.3 I_N$ until temperature stabilization occurs.	Within 60min at $1.6 I_N$
IEC 60127-2	S.S.1/S.S.2/S.S.5	After repeating 100 cycles of $1.2 I_N$ for 1h and switching-off for 15 min, $1.5 I_N$ can be passed through the fuse for 1h or more.	Within 30min at $2.1 I_N$
	S.S.3/S.S.6		Within 2min at $2.1 I_N$

## Time/current characteristic

As per Figure 9, it is possible to design fuses having the same rated current, but with differing I-t curves and time/current characteristics. Please consult your SOC sales representative when it is necessary to prevent fuse operations due to an inrush current, or when an abnormal current should be interrupted more quickly.

【Figure 9】 Examples of differences in I-t curves for the same rated current due to differing time/current characteristics

## Rated breaking current (capacity)

Rated breaking current is the maximum r.m.s. current value that a fuse is capable of safely interrupting at a circuit voltage equal to the rated voltage of the fuse, under the testing conditions specified by each standard. The specifications for the rated breaking current vary depending on which standard the fuse conforms to, as per Table 4.

【Table 4】 Examples of rated breaking currents (capacities) compared by standard

Ordinances and standards		Type/ Characteristic	Rated voltage	Rated current ( <i>I<sub>N</sub></i> )	Rated breaking current (capacity)	Power factor	
Paragraph 1, Appended Table 3, Chapter 2 of the Ministerial Ordinance establishing technical requirements for electrical appliances and materials		For electronic equipment	125V / 250V	1A ≤	100A / 300A / 500A	0.7-0.8

## ■ What is the fuse's ambient temperature?

A fuse will operate when the fuse-element temperature exceeds the melting point of the metal it is comprised of due to Joule heating caused by overcurrents. The temperature of the fuse-element is strongly influenced by heat dissipation. As can be seen from Figure 10, such heat dissipation differs according to the heat conduction or heat capacity of the surroundings such as the fuse clip, fuseholder, wiring, and board, as well as the ambient temperature conditions.

The fuse's I-t curve, for example, varies depending on the ambient temperature conditions as in Figure 11. Therefore, it is essential that final equipment testing be conducted with the end application subjected to actual mechanical, electrical, and ambient conditions to assure that satisfactory results and desired reliability will be achieved.

The effect of ambient temperature on an I-t curve can be confirmed by temperature rerating as shown in Figure 12. Please contact your SOC sales representative for temperature rerating information.

【Figure 10】 Example of heat dissipation for a glass cartridge fuse

【Figure 11】 Example of changes to an I-t curve due to the ambient temperature

【Figure 12】 Example of temperature rerating

## Certification

The following is an explanation of the markings on fuses and their packaging.

### PSE Mark

This is a marking based on the Electrical Appliance and Material Safety Law (EAMSL) of Japan. As per the EAMSL, parts of electrical facilities for general use, or machines, appliances or materials for use in connection thereto, stipulated by one of the cabinet ordinances (the Enforcement Ordinance of the EAMSL), are regulated as electrical appliances and materials.

In regard to fuses, those rated AC 100 V to 300 V and 1 A to 200 A inclusive are categorized as electrical appliances and materials according to the cabinet ordinance. SOC as an enclosed fuse manufacturer notifies the Ministry of Economy, Trade and Industry (METI) of the type classifications, specified in the Enforcement Regulations of the EAMSL, of enclosed fuses that SOC manufactures in accordance with the EAMSL.

Fuses SOC manufactures rated AC 100 V to 300 V inclusive and equal to or greater than 1A (hereafter called “the relevant fuses”) are categorized as specific electrical appliances and materials, as per the cabinet ordinance. Unless the relevant fuses satisfy the requirements provided in the EAMSL, they shall not, as a general rule, be sold in Japan.

One of the requirements is that the relevant fuses shall be marked with the items stipulated to be marked in the Enforcement Regulations in a certain way prescribed therein.

In order to be allowed to bear such marking, the relevant fuses are required to be in compliance with the technical requirements stipulated in the METI Ordinance establishing technical requirements for electrical appliances and materials, and sample fuses that fall within the same type classification of the relevant fuses must be tested by a test house registered with the METI to receive at least one valid conformity test certificate for each type classification.

SOC applies to the Japan Electrical Safety & Environment Technology Laboratories (JET) for conformity test certificates, which are valid for 7 years from the date issued, so that at least one valid conformity test certificate for each type classification, which the relevant fuses for the Japanese market fall within, can be kept.

In principle, packing labels for the relevant fuses for the Japanese market are marked with the PSE Mark  and **JET**, the abbreviated name of the Japan Electrical Safety & Environment Technology Laboratories, adjacent to  as well as our trademark SOC and electrical ratings. The position of **JET** is under or on the right side of . The relevant fuses are marked with SOC. If there is sufficient space, the relevant fuses for the Japanese market are also marked with .

Example of PSE Mark

Some fuses, however, despite being specific electrical appliances and materials, are not marked with  **JET**, nor are the packing boxes for these fuses. These are fuses which have been manufactured entirely for export to countries outside of Japan.

### Cautions about fuses to be used in Japan

Fuses which fall within the ratings listed below and are intended to be employed for the protection of electrical appliances to be used in Japan shall not be sold in Japan unless they are marked in accordance with the Electrical Appliance and Material Safety Law (EAMSL) of Japan.

Therefore, when purchasing fuses falling within the following ratings for employment in electrical appliances to be used in Japan, make sure the fuses are marked as stipulated in the EAMSL. Never use such fuses in electrical appliances to be used in Japan if they are not marked in this way.

Applicable ratings: AC 100 V – 300 V, 1 A – 200 A

## Certification marks for North America

Here follows an explanation of the markings shown on products which have received either UL (Underwriters Laboratories Inc.) or CSA (Canadian Standards Association) product certification services.

### ■ UL Listing Mark

This is a mark based on the UL Listing and Follow-Up Services. UL tests product samples (fuses) to confirm conformity with the applicable UL standards. After a set of reports are issued by UL, authorization to use the UL Listing Mark is provided based on the conditions listed in the reports.

UL Listing Mark

In order to confirm that the fuses produced afterward are continuously in conformance to the requirements described in the reports, UL conducts quarterly on-site inspections and sampling tests as Follow-Up Services.

The standard with which SOC fuses must conform is UL 248-14: Supplemental Fuses, in principle. This standard is Part 14 of UL 248 Low-Voltage Fuses, which consists of 16 parts. The UL 248 standards are harmonized among the United States, Canada, and Mexico. The requirements of the UL and CSA standards are the same for Part 14 as listed below:

ANSI / UL 248-14 = CAN / CSA C22.2 No. 248.14

In 1992, the Standards Council of Canada (SCC) granted UL Canadian Certification Organization and Testing Organization status providing services for Canada to complement its United States program, which accredits UL to conduct tests and issue certifications to Canadian National Standards.

Several years ago, SOC began applying for the Canadian as well as the United States certification, when it applied for new UL product certification. In this instance, as the requirements of both the UL and CSA standards are the same, use of the C-UL US Listing Mark is accepted in the issued reports without the need for additional testing, with a description stating that, in addition to UL 248-14, the requirements of CSA C22.2 No. 248.14 have also been evaluated.

C-UL US  
Listing Mark

UL Listing Mark for Canada  
and the United States

As long as space permits, the UL Listing Mark is marked on fuses. As for cartridge fuses, it is die-stamped on the side of one of their end-caps. Along with either the UL Listing Mark or the C-UL US Listing Mark, "Listed," "360C," and the product identity ("SUPPLEMENTAL FUSE," "MISCELLANEOUS FUSE," "MINIATURE FUSE" or "MICRO-FUSE") are also printed on their packing box. "360C" is the control number assigned to SOC.

## ■ UL Recognized Component Mark

This mark is based on the UL Component Recognition and Follow-Up Services. As in the UL Listing Service, UL tests product samples (either fuses or fuseholders) in order to issue a set of reports and authorize the use of the UL Recognized Component Mark under the conditions as specified in the reports. Additionally, in order to confirm that the fuses produced afterward are continuously in conformance to the requirements described in the reports, UL conducts quarterly on-site inspections and sampling tests as Follow-Up Services.

UL Recognized  
Component Mark

Although the Listing Service requires that the fuses conform to the UL standard, the Component Recognition Service does not necessarily require this as it is possible to change a portion of the UL standard requirements. For example, although the 5 × 20 mm cartridge fuses based on IEC 60127-2 do not meet the time/current characteristic of the UL standards, they can be applied for for the Component Recognition Service according to the characteristic and the breaking capacity stipulated by the IEC standard. Fuses having only the DC rating can also be applied for for this service. SOC applies for this service for some of its fuseholders as well.

The Recognized Components which have undergone the Component Recognition and Follow-Up Services are, as the name suggests, components to be employed in equipment. UL evaluates whether the fuse or fuseholder is appropriate for use in the end-equipment, and if it is a fuse, whether the fuse can appropriately protect the equipment.

As with the Listing and Follow-Up Services, when certification for both the United States and Canada is applied for under the Component Recognition and Follow-Up Services, use of the C-UL US Recognized Component Mark is accepted.

C-UL US Recognized  
Component Mark

Recognized Component  
Mark for Canada  
and the United States

In principle, SOC marks the Recognized Component Mark or the C-UL US Recognized Component Mark on the packing box instead of on the product itself.

## ■ CSA Mark

This mark is based on the CSA Certification Service, which is essentially the same as the UL Listing and Follow-Up Services. Use of this mark is authorized under the conditions as stated in the reports issued under this service. On-site inspections and sampling tests are conducted as Factory Audit.

As long as space permits, this mark is marked on fuses. As for cartridge fuses, it is die-stamped on the side of one of their end-caps. This mark is also printed on the packing box.

CSA Mark

## ■ CSA Component Acceptance Mark

This mark is based on the CSA Component Acceptance Service, which are again essentially the same as the UL Component Recognition and Follow-Up Services. For the CSA Component Acceptance Mark, a triangle is added to the CSA Mark. On-site inspections and sampling tests are conducted as Factory Audit as well.

In principle, SOC prints the CSA Component Acceptance Mark on the packing box instead of on the product itself.

CSA Component  
Acceptance Mark

## Certification marks for Europe

### ■ S Mark

This mark is based on the certification service provided by Intertek Semko AB (SEMKO).

SEMKO tests product samples in accordance with the requirements of the applicable EN standards, and issues a certificate and accepts the use of the S Mark for products which can be confirmed as conforming to those requirements.

Should SEMKO judge that product samples conform to minimum safety requirements, it is possible to partially modify the testing conditions of the EN standard. Testing, issuance of a certificate, and authorization to use the certification mark are then carried out under these modified testing conditions.

In contrast to the case of UL or CSA, the certification mark in this situation is the same as the one which is approved for usage for conforming to EN standards, the S Mark.

For marking on the packing box for SOC fuses which have received this certification, the S Mark is used. For marking on the fuse itself, however, use of the S mark without "Intertek" anchored below the certification mark is accepted as it is impractical to provide the S Mark due to limited space on the fuse.

S Mark without "Intertek"  
anchored below  
the certification mark

### ■ Kitemark

This is a certification mark based on the Kitemark Licence issued by the British Standards Institution (BSI). BSI issues the Kitemark Licence in those cases where the product sample is confirmed by testing to conform to the relevant British Standards, and additionally where the quality system for its production conforms to BS EN ISO 9001. BSI grants the right to use the Kitemark based on the Kitemark Licence. Twice yearly on-site inspections and sampling tests are conducted for continued use of the mark. For those cartridge fuses which have received the Kitemark Licence, the Kitemark is marked on the side of one of their end-caps.

BSI has granted the Kitemark Licence to SOC's Akita Factory based on the standard "BS EN 60127-2: Miniature fuses. Cartridge fuse-links (5 × 20 mm)."

The quality management systems employed in SOC's Akita Factory and Tochigi Factory have been certified in accordance with BS EN ISO 9001: 2008.

## Terminology/Abbreviations

### ■ Explanations of terminology and abbreviations used in this catalog

11CT type	: The 11CT type includes the following fuses: 11CT, 11CF, P11CT, P11CF, DC35V11CT, DC35VP11CT, DC35VP11CF, DC86V11CT, and 32V11CF
25CT type	: The 25CT type includes the following fuses: 25CT, 25CF, P25CT, P25CF, DC35VP25CT, DC35VP25CF, and DC300V25CF
25RT type	: The 25RT type includes the following fuses: 25RT, 25RF, P25RT, P25RF, DC35VP25RT, and DC35VP25RF
36CFA type	: The 36CFA type includes the following fuse: 36CFA
36CT type	: The 36CT type includes the following fuse: 36CT
MCF2 type	: The MCF2 type includes the following fuses: MCF2
SM4 type	: The SM4 type includes the following fuses: SM4 and PSM
SMC type	: The SMC type includes the following fuse: SMC
AC	: Alternating current
DC	: Direct current
I-t curve	: Pre-arcing time/current characteristic
BSI	: British Standards Institution
BSI Licensed	: Products for which the Kitemark Licence has been issued
CSA	: Canadian Standards Association
CSA Certified	: Products that have been subjected to and passed the CSA Certification Service
CSA Component Acceptance	: Products that have been subjected to and passed the CSA Component Acceptance Service
C-UL US Listed	: Products that have been subjected to and passed the UL Listing Service, and have also been certified by UL as being in compliance with the requirements of Canada
C-UL US Recognized	: Products that have been subjected to and passed the UL Recognized Component Service, and have also been certified by UL as being in compliance with the requirements of Canada
EN	: Europäische Norm (Ger.), Norme Européenne (Fr.), European Standard (Eng.)
IEC	: International Electrotechnical Commission
<PS>E JET	: Products falling under the type classification for which the conformity test certificate has been issued in accordance with the Electrical Appliance and Material Safety Law of Japan
RoHS	: EU Directive on the restriction of the use of certain hazardous substances in electrical and electronic equipment
SEMKO	: Intertek Semko AB
SEMKO Certified	: Products that have been subjected to and passed the SEMKO certification service
UL	: Underwriters Laboratories Inc. (USA)
UL Listed	: Products that have been subjected to and passed the UL Listing Service
UL Recognized	: Products that have been subjected to and passed the UL Recognized Component Service

## Safety Precautions

### WARNING

Failure to properly select, install, and use fuses may result in not only property damage but also serious injury and/or death. This catalog contains references to only a portion of the data available for the products included. Before making a final fuse selection, confirm the final product specifications and parameters with one of SOC's local sales representatives.

- Use fuses within their specification requirements. Exceeding specification requirements may lead to an accident.
- Before final fuse selection, always test the proposed fuse in your actual equipment to ensure that the fuse satisfies all your operational and safety requirements.
- Be aware that the breaking ability of a fuse will differ depending on whether the circuit is an AC or a DC circuit. Fuses intended for use in AC circuits should therefore not be employed in DC circuits, and vice versa, as this may result in accidents such as explosions, property damage, and/or serious injury. (Refer to P. 178 of this catalog.)
- Make sure to consider the effect of ambient temperature when you use a fuse. Fuse electrical characteristics may vary depending on the temperature. (Refer to P. 188 of this catalog.)
- Do not use fuses where they may be exposed to high-temperature and/or high-humidity conditions exceeding specification requirements. Doing so may lead to nuisance operations and/or disconnection of the fuse-element which may result in an accident. Confirm the specification requirements with one of SOC's local sales representatives as requirements may vary by product type.
- Use fuses in places where vibration and impact levels are within the specified limits. When using fuses in an application or equipment which may be subjected to vibrations and/or impacts, confirm the specification requirements with one of SOC's local sales representatives as requirements may vary by product type. Exceeding these limits may result in nuisance operations and/or disconnection of the fuse-element, which may lead to an accident.
- Do not use fuses where they may be exposed to corrosive gasses and/or flammable gasses. Doing so may result in nuisance operations, disconnection of the fuse-element, and/or explosions.
- Do not use ultrasonic cleaning on fuses. Ultrasonic cleaning may result in disconnection of the fuse-element, which may lead to an accident.
- Coating or potting a fuse may change its electrical characteristics. Please consult your SOC sales representatives before applying treatment as this may result in accidents.
- Never force a fuse into a fuseholder. Doing so may result in damage to the fuse or contact failure due to changes in the shape of the fuseholder clip. This can significantly affect the electrical characteristics and/or the service life of the fuse, and may lead to an accident.
- Turn off all power leading to the fuse before touching it. Failure to do so may result in electrocution or serious burns.
- When using a fuse in a life support system or other equipment that relates to health and/or requires high reliability or the like, carefully examine and evaluate the fuse in actual circuit conditions to be certain that it is an appropriate application.
- Use sample fuses only for evaluation. Do not reuse sample or other used fuses. Properly dispose of fuses in accordance with local laws and regulations.

## IMPORTANT NOTICES

- Special operating, electrical, and/or mechanical characteristic limits for products covered in this catalog, as well as their availability, are subject to change without prior notice.
- The content of this catalog was considered to be reliable at the time of its preparation—February 2012; however, the accuracy of information in this catalog cannot be guaranteed. Check with your local SOC sales representative before finalizing your fuse selection.
- Questions related to specific product applications, specifications or performance characteristics may be directed to SOC's sales representatives.

**NEW**

The DC450VBT3050A 360A employs a highly reliable wire-type fuse-element especially developed to protect the circuits of electric and hybrid vehicles with large main battery capacities. We have unprecedentedly improved the breaking performance of this wire-type fuse-element, successfully realizing this highly durable and reliable fuse.

Scale: 1/2

Unit: mm

The I-t curve above is a plot of the average values of measurements obtained under conditions specified by SOC. These data are for reference only and are not intended to infer any guaranteed values.

Rated voltage	Certification	Rated current ( $I_N$ )	Rated breaking current		Minimum breaking current *1	Current carrying capacity
DC450V	—	360A	2700A	Resistive circuit	850A	0.5/ $I_N$ until temperature stabilization occurs.

\*1: If the current is less than 850 A (represented by the dotted portion of the I-t curve), an arc current may continuously pass through the fuse, and it may therefore not be possible to break the current. Do not apply fusing conditions of currents less than 850 A, as fires and other accidents may occur due to the inability to open the circuit.
